PT

A ideia de uma arquitectura vernácula (esquecida) e da forma como ela procura formar um discurso claro entre a paisagem e as necessidades programáticas é algo que sempre admiramos. Um bom exemplo deste discurso, são as estruturas de apoio à agricultura (normalmente com função de celeiros/espigueiros), que de uma forma mais ou menos aleatória iam pontuando a paisagem rural, como blocos de aparência efémera que levitavam sobre o solo. É precisamente esta ideia de “leveza gravítica” que nos fascina e na qual assenta o conceito deste projecto.

Genericamente, a proposta apresenta uma tripartição segundo os elementos vernáculos, a Base, com uma imagem de monobloco estático e megalítico, onde se encerram as funções de serviço da casa, a zona de Pilotis, identificado com os programas mais públicos da habitação, que explora a relação visual e física com o exterior, através dos enormes vãos de vidro que transmitem a ideia de leveza e fraqueza estrutural pretendidas, e por fim o Bloco geométrico que parece “gravitar”, onde se situam os espaços privados da habitação.

O conceito da tripartição é ainda complementado com uma escolha de materiais que procura explorar a fragilidade aparente da madeira em contraste com os blocos de pedra negra (na base) e o bloco de betão (no piso superior).

ENG

The idea of a vernacular architecture (forgotten) and how it seeks to form a clear speech between the landscape and programmatic needs is something that we always admire.

A very successful example of this discourse, are the structures to support agriculture (normally function barns / granary), which in a more or less random would punctuate the countryside, as blocks of ephemeral appearance that levitated on the ground.

It is precisely this idea of "gravitational lightness" that fascinates us and which is based the concept of this project.

Generally, the proposal presents a tripartition according to the vernacular elements, the base, with an image of a static and megalithic mono-block, which includes the service functions of the house, the open area, identified with the more public housing programs, which explores the visual and physical relationships with the outside through the huge glass windows that transmit the idea of lightness and structural weakness sought with the concept, and finally the geometric block that seems to "gravitate", where are the private spaces of the house. The concept of tripartition is complemented with a choice of materials that seeks to exploit the apparent weakness of wood in contrast to the black stone block (base level) and the concrete block (upper level).

DATA

Code: 07CBE

Project: PRIVATE BUILDING

Year: 2007 - 2013

Size: 800m2

Address: Paredes

Client: Private

Author: spaceworkers®

Team

principal architects: henrique marques | architect

rui dinis | architect

architects: rui rodrigues | architect

sérgio rocha | architect
